WHAT IS CLAIMED IS:

- 1. A coded microcarrier having immobilized on its surface a plurality of quenched, labeled 1 signaling hairpin molecules each comprising an interacting affinity pair separated by a 2 linking moiety, one member of the affinity pair having bound thereto at least one 3 fluorophore and the other member of the affinity pair having bound thereto at least one 4 quencher, wherein interaction of the affinity pair of each hairpin molecule is disruptable 5 by a physical or chemical change in a condition of its environment, wherein the 6 disruption of the interaction of at least one affinity pair occurs at a first level of said 7 condition and the disruption of the interaction of at least another affinity pair occurs at a 8 second level of said condition, and where said disruptions are optically differentiable. .9
- 2. A microcarrier according to claim 1 wherein said affinity pair comprises complementary nucleotide sequences
- A microcarrier according to claim 2 wherein said linking moiety is an oligonucleotide
 sequence
- 4. A mixture of a plurality of coded microcarriers according to claim 1 suitable for use in a distributed microarray, wherein the individual microcarriers each have immobilized thereon a capture probe and wherein the coding scheme for identifying individual microcarriers in said mixture comprises a combination of from three to eight spectrally deconvariable fluorophores and at least three affinity pairs disruptable at detectably different levels of said condition.
- 5. The mixture according to claim 4, wherein said affinity pair comprises complementary nucleotide sequences.
- 1 6. The mixture according to claim 4 wherein individual microcarriers are immobilized at the 2 ends of fibers in a fiber-optic bundle.
- 7. The mixture according to claim 4 which contains a plurality of identically coded microcarriers having immobilized thereon the same capture probe.

- 1 8. The mixture according to claim 4 wherein the capture probes are molecular beacon probes.
- 9. A hybridization assay for a multiplicity of nucleic acid sequences in an analyte utilizing a mixture of claim 4, including steps of:
- a) contacting said mixture and said analyte,
- b) forming a distributed array of said microcarriers,
- 5 c) determining which microcarriers have capture probes hybridized to nucleic acid
- 6 sequences of said analyte, and
- 7 d) optically decoding said microcarriers to identify the sequences of their capture
- 8 probes.
- 1 10. The assay according to claim 9 wherein step a) precedes step b).
- 1 The assay according to claim 9 wherein the step of decoding includes disrupting said
- 2 affinity pair by increasing temperature.
- 1 12. The assay according to claim 9 wherein the step of decoding includes disrupting said
- 2 affinity pair by addition of a denaturant.
- 1 13. The assay according to claim 9 wherein said distributed array is a planar array.
- 1 14. The assay according to claim 13 wherein the planar array comprises microcarriers
- 2 affixed to the ends of fibers of a fiber-optic bundle.
- 1 15. The assay according to claim 9 wherein said distributed array is a linear array.
- 1 16. The assay according to claim 15 wherein steps c) and d) include flow cytometry.
